

Practice Set 3 with and without parameters

1. Write a Python Code `reverse_string(s)` that takes a string `s` and returns the string reversed using a loop.

```
#with parameter
def reverse_string(s):
    rev = ""
    for char in s:
        rev = char + rev
    return rev

#without parameter
def reverse_string():
    s = input("Enter a string: ")
    rev = ""
    for ch in s:
        rev = ch + rev
    print("Reversed string:", rev)
```

2. Write a Python Code `multiplication_table(n)` that takes a positive integer `n` and prints the multiplication table of `n` up to 10 using loops.

```
#without parameter
def multiplication_table():
    n = int(input("Enter a number: "))
    for i in range(1, 11):
        print(n, "*", i, "=", n * i)

#with parameter
def multiplication_table(n):
```

```
for i in range(1, 11):
    print(n, "x", i, "=", n * i)
```

3. Write a Python code that takes a string s and a character char and returns the number of occurrences of char in s using a loop and if-else statements.

```
#without parameter
def count_char():
    s = input("Enter a string: ")
    char = input("Enter a character: ")

    count = 0
    for char in s:
        if char == char:
            count += 1
        else:
            pass

    print("Number of occurrences:", count)

#with parameter
def count_char(s, char):
    count = 0
    for ch in s:
        if ch == char:
            count += 1
        else:
            pass
    return count
```

4. Write a Python Code that takes a positive integer n and returns a list of the squares & Cube of all numbers from 1 to n using a loop.

```

#without parameter
def square_cube():
    n = int(input("Enter a positive number: "))
    for i in range(1, n + 1):
        print("Number:", i)
        print("Square:", i * i)
        print("Cube:", i * i * i)

    #with parameter
    def square_cube(n):
    for i in range(1, n + 1):
        print("Number:", i)
        print("Square:", i * i)
        print("Cube:", i * i * i)

```

5. Write a Python code that prints numbers from 1 to n.
 For multiples of 3, print "Fizz" instead of the number.
 For multiples of 5, print "Buzz" instead of the number.
 For numbers that are multiples of both 3 and 5, print "FizzBuzz"

```

#without parameter
def fizz_buzz():
    n = int(input("Enter a number: "))
    for i in range(1, n + 1):
        if i % 3 == 0 and i % 5 == 0:
            print("FizzBuzz")
        elif i % 3 == 0:
            print("Fizz")
        elif i % 5 == 0:
            print("Buzz")
        else:
            print(i)

    #with parameter

```

```
def fizz_buzz(n):  
    for i in range(1, n + 1):  
        if i % 3 == 0 and i % 5 == 0:  
            print("FizzBuzz")  
        elif i % 3 == 0:  
            print("Fizz")  
        elif i % 5 == 0:  
            print("Buzz")  
        else:  
            print(i)
```
